```

Table of Contents (alphabetic ordered)

- **cut_plane(nv=[0,0,1],size=[5,5],thickness=10,trns1=0,trns2=0,trns3=0)** : function for defining a solid (cutting plane) oriented as per the defined normal vector, nv: normal vector for defining plane orientation of the section, thickness: thickness or height of the cutting plane, trns1: translate the solid in the direction of normal vector 'nv', trns2: translate the solid in the direction 'right' to the normal vector 'nv', trns3: translate the solid in the direction 'up' to the normal vector 'nv', '-ve' values given to the trns1,trns2,trns3 will translate the solid in the reverse direction
- **cw(sec)** : function to identify if an enclosed section is clockwise(cw) or counterclockwise(ccw). this returns 1 if section is clockwise and -1 if it is counterclockwise
- **cwv(sec)** : function to identify whether each point in a section is clockwise or counter clockwise.
- **cylinder(r1=1,r2=1,h=1,cp=[0,0],s=50,r=0,d=0,d1=0,d2=0,center=False)** : function for creating cylinder, cone
- **cylinder-with-rectangular-pocket** :
- **cylinder-with-star-pocket** :
- **cytz(path)**: converts 'y' points to 'z' points in a 2d list of points
- **drill-bit** :
- **e_wave(l,a,w,t)** : create a graph of exponential function a*e^-(wt) where, w: omega, t: time steps, a: amplitude, l: length of time
- **end_cap(sol,r=1,s=10)** : function to draw radius at the ends of 'path_extrude_open' models. sol: path extruded solid, r: radius at the ends, s: segments of the radius
- **equidistant_path(path,s=10)** : divides a path in to equally spaced points
- **equidistant_pathc(path,s=10)** : divides a closed path in to equally spaced points
- **equivalent_rot_axis(r1=[])** : function returns an equivalent axis for rotation and angle of rotation for a sequence of rotations given by list 'r1'
- **example-of-rounding** :
- **exclude_points(list1,list_to_exclude)** : function to remove points from a list
- **f_prism(sec,path)** : creates a solid or prism with a 2d section and a 2d path. This is a much faster version of function prism, but may not work with few shapes correctly)
- **faces(l,m)** : calculate the faces for the vertices with shape l x m with first and the last end closed
- **faces_1(l,m)** : calculate the faces for the vertices with shape l x m with first and the last end open
- **fillet_2cir(r1,r2,c1,c2,r,s=50)** : fillet between 2 circles with radius 'r1' and 'r2' and center points 'c1' and 'c2' and 'r' is the radius of the fillet
- **fillet_3p_3d(p0,p1,p2,r,s)** : fillet with 3 known points 'p0,p1,p2' in 3d space
- **fillet_3p_3d_cp(p0,p1,p2,r)** : center point 'cp' of the fillet with 3 known points 'p0,p1,p2' in 3d space. 'r' is the radius of fillet
- **fillet_line_circle(l1,c1,r2,cw=-1,option=0,s=50)** : function to draw a fillet between a line and a circle, option can be '0' or '1' to flip the fillet from one side to another, 's' is the number of segments in the arc
- **filleto_2cir(r1,r2,c1,c2,r,s=50)** : fillet between 2 circles with radius 'r1' and 'r2' and center points 'c1' and 'c2' and 'r' is the radius of the fillet. This is an open fillet where first or the second fillet can be called based on requirement
- **flip(sec)** : flips the sequence of a list or list of points
- **gcd(a,b)** : calculates greatest common divisor for 2 numbers
- **glass-model** :
- **handling-trolley** :
- **helix(radius=10,pitch=10, number_of_coils=1, step_angle=1)** : creates helix
- **honeycomb(r,n1,n2)** : function to draw a honeycomb structure with radius 'r', n1: number of hexagons in 1 layer, n2: number of layers
- **i_line_fillet(sol1,sol2,ip,r1,r2,s=20,o=0)** : calculates a fillet at the intersection of 2 solids when the intersection points 'ip' are separately defined. r1 and r2 would be same in most of the cases, but the signs can be different depending on which side the fillet is required. r1 is the distance by which intersection line offsets on sol2 and similarly r2 is on sol1
- **i_line_planes(p1,p2)**: intersection line between 2 planes 'p1' and 'p2'
- **i_p_n(sol,i_p)** : calculates normal at the intersection points, sol: solid on which the normal is required, i_p: list of intersection points between 2 solids
- **i_p_p(sol,i_p,r)** : function to project the intersection point on the cutting lines based on the distance 'r'
- **i_p_t(path)** : function to calculate tangent vectors to a given path
- **intersections(segments)** : calculates the intersections of adjacent line segments only
- **ip(prism,prism1,side=-1)**: function to calculate intersection point between two 3d prisms. "prism" is the 3d object which is intersected with "prism1". side: when a ray intersects a solid it can intersect at 2 locations, if the ray is travelling from outside, in that case if '0' is given meaning only the first intersection point is considered, and in case '-1' is given meaning the last intersection point will be considered.)
- **ip_fillet(sol1,sol2,r1,r2,s=20,o=0)** : calculates a fillet at the intersection of 2 solids. r1 and r2 would be same in most of the cases, but the signs can be different depending on which side the fillet is required. r1 is the distance by which intersection line offsets on sol2 and similarly r2 is on sol1
- **ip_sol2line(sol,line)** : function to calculate intersection point between a 3d solid and a line. "sol" is the 3d object which is intersected with a "line". in case there are more than 1 intersections of the line with the solid/ prism ip(sol,line)[0] will give the first intersection point and ip(sol,line)[-1] will give the last intersection point
- **ip_sol2sol(sol,sol1,n=0)** : function to find the intersection point between 2 solids. this function is to be used where the cutting lines of sol1 are intersecting sol at more than 1 times.sol: solid which is intersected. sol1: this intersects the solid 'sol'. n: if the first intersection points of all the cutting lines are to be considered, value of n should be '0'. if the last intersection points of all the cutting lines are to be considered, value of 'n' should be set to '-1'
- **ip_triangle(sol1,p0)** : finds the trianle where the intersection point "p0" lies in a solid "sol1"
- **iterative-approach-towards-creating-fillets** :
- **l_cir_ip(line,cir)** : line circle intersection point
- **l_len(l)** : calculates length of a line 'l'
- **l_lenv(l)** : calculates sum of lengths of all the segments in a line 'l' considering the section is closed
- **l_lenv_o(l)** : calculates sum of lengths of all the segments in a line 'l' considering the section is open
- **l_sec_ip(line,sec)** : line and section intersection point
- **l_sec_ip_3d(sec,line)** : finds the intersection points between a section in 3d space and a line in 3d space
- **l2l_intersection(l1,l2)** : function to find the intersection point between 2 lines in 3d space
- **lamp** :
- **lcm** : calculates least common multiple for 2 numbers
- **lexicographic_sort_xy(p)** : function sorts the points list 'p' first with x and then with y smallest to largest
- **lexicographic_sort_yx(p)** : function sorts the points list 'p' first with y and then with x smallest to largest
- **linear_extrude(sec,h=1,a=0,steps=1)** : function to linear extrude a section where, se/users/sanjeevprabhakar section to extrude, h: height of the extrusion, a: angle of twist while extruding, steps: number of steps in each angular extrusion
- **list_r(sec)** : function list the corner radiuses of a given section (only where the radius is specified)
- **ls(line,n)**: plots 'n' points in a straight line)
- **m10** :
- **m35** :
- **m39** :
- **max_r(sec)** : finds the maximum radius of a given closed section)
- **mobile-phone-stand** :

- **multiple_sec_extrude(path_points=[],radiuses_list=[],sections_list=[],option=0,s=10)**: path_points: are the points at which sections needs to be placed,radiuses: radius required at each path_point. this can be '0' in case no radius required in the path, sections_list= list of sections required at each path_points. same section can be provided for various path_points as well, option: can be '0' in case the number of points in each section do not match or '1' in case number of points for each section are same, s: in case value of radiuses is provided 's' is the number of segments in that path curve
- **normals_along_path** :
- **nv(p)** : finds the normal vector for a given points in a 3d plane
- **o_3d(i_p,sol,r,o=0)** : function to offset the intersection points 'i_p' on a solid 'sol' by distance 'r'. option 'o' can have values '0' or '1' and changes the direction of offset
- **o_p_p(sol,i_p,d)**: calculates projected points on the surface of a solid , sol: solid on which the points to be projected, i_p: list of points in 3d space near the solid, d: approximate distance of the points from the surface, specifying too big distance , may create multiple projection of the same point on the solid
- **o_solid(nv=[0,0,1],sec=[],thickness=10,trns1=0,trns2=0,trns3=0, theta=[0,0,0])** : function for defining a solid with any defined section. solid gets oriented as per the defined normal vector, nv: normal vector for defining plane orientation of the section, se/users/sanjeevprabhakar cross section of the solid, thickness: thickness or height of the solid, trns1: translate the solid in the direction of normal vector 'nv', trns2: translate the solid in the direction 'right' to the normal vector 'nv', trns3: translate the solid in the direction 'up' to the normal vector 'nv', '-ve' values given to the trns1,trns2,trns3 will translate the solid in the reverse direction , theta: rotate the section around axis fox example if nv is [1,0,0] or x-axis, the sequence of rotation will be x, y ,z axis
- **offset(sec,r)** : calculates offset for a section 'sec' by amount 'r'
- **offset_3d(sec,d)** : offsets an enclosed section in 3d space, in case the section is in 1 plane, se/users/sanjeevprabhakar section in 3d space, d: offset distance -ve sign means inner offset and +ve sign is outer offset
- **offset_points(sec,r)** : function to calculate offset of a list of 2d points. in defining sections, providing corner radius is a must
- **offset_points_ccw(sec,r)**: function to offset only those points which are counter clockwise
- **offset_points_cw(sec,r)** : function to offset only those points which are clockwise
- **offset_seg_cw(sec,r)** : function offsets the segment only when the point is clockwise
- **offset_segv(sec,d)** : function makes the segments of the original section and offset each segment by a distance 'd'
- **orthos_along_path(path,scale=1)** :
- **oset(sec,r)** : function to draw offset of a section 'sec' with distance 'r'
- **p_cir_t(p,cir)** : point to circle tangent line (point should be outside the circle)
- **p2p_intersecion_line(pa,pb)** : function to calculate intersection line between 2 planes in 3d space
- **path_extrude_closed(sec,path,twist=0)** : function to extrude a closed section to a closed path. closed path means the path provided has it's first and the last point same example a circle
- **path_extrude_open(sec,path,twist=0)**: function to extrude a closed section to an open path. twist can be set either to '0' or '1' depending on the shape produced
- **path_offset(path,d)** : function to offset a 'path' by 'd' distance
- **pies1(sec,pnts)** : function to find points 'pnts' which are inside an enclosed section 'sec'
- **plane(nv,size=[100,100])** : plane defined by normal 'nv' and 'size'
- **plos (surf,line,vector,unidirection)** : function to project line on a surface, vector is the vector in which direction the projection is required, unidirection is set to '1' by default meaning the projection will happen only in the direction of vector, if this parameter is set to '0' then the projection will happen in both direction, that of vector and opposite to vector
- **pntsnfaces(bead2)** : function returns points and faces of a prism
- **points_inside_offset_surround(sec,sec2,r)** : function returns points in a list 'sec2' which are inside the offset surround of a section 'sec' with offset radius of 'r'
- **ppesec(p0,sec)**: point's projection on an enclosed 3d section
- **ppplane(p0,v1,loc)** : function to find projected points of a given list of points 'p0' on a plane defined by normal'v1' and location 'loc'
- **prism(sec,path)** : function to make a prism with combination of 2d section and 2d path
- **prism2cpo(s1)** : function to change the orientation of the surface
- **psos(s2,s3,v1)** : function to project a surface on to another
- **pts(p)** : calculates the cumulative sum of 2d list of points 'p'
- **pts1(p)**: 'p' is a list of points. function calculates the cumulative sum of x,y values in the list while z value remains the same. this is mainly used in function corner_radius(pl,s).
- **q(vector=[1,0,0],point=[0,5,0],theta=0)** : function to rotate a point around a vector(axis) with angle theta)
- **rot(a,sol)** : function to rotate a group of points around a series of axis with defined angles
- **rot2d(theta,sec)** : function to rotate a 2d point or 2d points list by an angle theta around z-axis
- **r_sec(r1,r2,cp1,cp2)** : creates a rounded section around a line defined by points 'cp1' and 'cp2'. radius around 'cp1' is 'r1' and radius around 'cp2' is 'r2'
- **reorient_sec(sec)** :re-orient section to create a better surface through 'prism' function
- **rounding-various-rounded-cubes** :
- **rsz2d(sec,rsz)** : function to resize a 2d section to dimensions 'rsz'. resized section will be placed on bottom center of the original section
- **rsz2dc(sec,rsz)** : function to resize a 2d section to dimensions 'rsz'. resized section will be placed in center of the original section
- **rsz3d(prism,rsz)** : function to resize a 'prism' to dimensions 'rsz'. bottom left corner of both the prisms would be same
- **rsz3dc(prism,rsz)** : function to resize a 'prism' to dimensions 'rsz'. resized prism will be placed in the center of the original prism or center point of both the prisms will be same
- **s_int(s)** : calulates the self intersection points of a list of line segments 's'. it also picks the points in case the 2 lines are just connected at 1 point and are not crossing
- **s_int1(s)**: calcultes the self intersecting segments such that there is a complete intersection and not only end points touching
- **samsung-tab-s6-holder** :
- **scl2d(sec,sl)**: scale a 2d section to a scaling factor 'sl')
- **scl2d_c(sec,sl)** : scale a 2d section such that the center of original and scaled section is same)
- **scl3d(p,s)** : scale any 3d prism to a scaling factor 's')
- **sec2vector(v1=[1,0,0],sec=[])** : function to align a section 'sec' with a vector 'v1'
- **sinewave(l,n,a,p)** : creates a sinewave with length 'l', number of cycles 'n' amplitude 'a' and number of points 'p'
- **sinwave-box** :
- **sl_int(sec,line)** : function to find intersection between an enclosed section in 3d space and a line
- **slice_sol(sol,n=10)**: function to slice a solid with 'n' intermediate steps
- **sol2path(sol,path)**: function to extrude a solid along a path
- **sol2vector(v1=[],sol=[],loc=[0,0,0])**: orients a solid as per a given vector
- **sort_points(sec,list1)** : function picks the nearest point of a section from a reference section and matches the length of points for the 2 compared sections
- **sphere(r=0,cp=[0,0,0],s=50)** : function to draw sphere with radius 'r' , center point 'cp' and number of segments 's'
- **sunflower** :
- **surf_base(surf,h=0)** : creates a solid from any surface, 'h' is the height of the base of the surface
- **surf_extrude(sec,path)** : extrudes an open section 'sec' to a 3d 'path' to create surface

- **surf_extrudef(surf,t=-.05)** : surface with a polyline 2d sketch and a 3d path. thickness of the surface can be set with parameter "t". positive and negative value creates thickness towards +z and -z directions respectively
- **surf_offset(sec,d)** : function to offset the surface 'sec' by a distance 'd'
- **surface_for_fillet(sol1=[],sol2=[],factor1=50,factor2=10,factor3=1,factor4=100,dia=40)**: sol1: Solid on which the surface needs to be created. sol2: Intersecting solid. factor1: number of segments in the circle. factor2: number of layers or slices of surface. factor3: decides the size of the surface lower value means bigger size. value can be set between 1 to any number. factor4: any high number should be ok like maybe 100 or greater, basically greater than the bounding box dimension of the "sol1". dia: diameter around the solid 2 where surfavce needs to be created
- **surface_offset(surf,d)** : offsets the surface by an amount 'd'
- **surface_thicken(surf,d)** : Thickens the surface by an amount 'd'
- **SurfaceFrom3LinesInDifferentPlanes(w1,w2,w3,o=1)** : create surface with 3 lines in different planes
- **swp_prism_h(prism_big,prism_small)** : creats a hollow prism with 2 similar prisms (1 big and 1 smaller)
- **t_cir_tarc(r1,r2,cp1,cp2,r,side=0,s=50)** : function draws a arc which is tangent to 2 circles defined by radiuses 'r1' and 'r2' and center points 'cp1' and 'cp2'. 's' is the number of segments of the tangent arc. 'r' is the radius of the tangent arc (it should be >= (r1+r2+center distance of 2 circles)/2). 'side' there are 2 sides of the circles where the arc could be created defined by '0' and '1'
- **tangents_along_path(path,scale=1)** :
- **tcct(r1,r2,cp1,cp2,cw=-1)** : two circle cross tangent
- **tctp(r1,r2,cp1,cp2)** : 2 circle tangent points (one side) r1 and r2 are the radius of 2 circles and cp1 and cp2 are the center points)
- **tctpf(r1,r2,cp1,cp2)** : 2 circle tangent point full (both the sides))
- **translate(p,sec)** : translates a prism or section by [x,y,z] distance
- **translate_2d(p,sec)** : function to translate a group of points "sec" by "p" distance defined in [x,y]
- **v_sec_extrude(sec,path,o)** : extrude a section 'sec' through a path 'path' . section will vary from start to end such that at the end the section will be offset by 'o' distance
- **wrap_around** : complex function see the example to understand

surf_extrude
